

LINKEDIN QUIZ

MLOps Fundamentals

14-Question Checkpoint

Can you score 12/14 or better?

Topics covered:

- MLOps purpose and pain points
- CI, CD, Continuous Training
- Technical debt
- ML lifecycle and feasibility
- Deployment, monitoring, maturity levels

HOW TO USE

Swipe through the questions. Write your answers. Check the key at the end.

What is MLOps best described as?

- ☐ A. A model-training algorithm
- ☐ B. A lifecycle management discipline for machine learning
- ☐ C. A cloud storage technology
- ☐ D. A replacement for machine learning

PAUSE HERE: choose your answer before moving on.

Which challenge is commonly faced by ML practitioners?

- ☐ A. Keeping track of model versions, parameters, and experiments
- ☐ B. Avoiding all experimentation
- ☐ C. Using only one team role
- ☐ D. Removing model evaluation

PAUSE HERE: choose your answer before moving on.

Why is reproducibility important before production deployment?

- ☐ A. It guarantees 100% accuracy
- ☐ B. It lets the model and its process be recreated reliably
- ☐ C. It removes the need for data
- ☐ D. It prevents every kind of drift

PAUSE HERE: choose your answer before moving on.

Operationalizing an ML model means balancing which three things across the whole system?

A A. Accuracy, recall, and precision

B B. Time, resources, and quality

C C. CPU, GPU, and RAM

D D. Code, labels, and predictions

PAUSE HERE: choose your answer before moving on.

What is the central idea of Continuous Integration (CI)?

- ☐ A. Keep changes separate indefinitely
- ☐ B. Frequently integrate changes and automatically build/test them
- ☐ C. Deploy every model without testing
- ☐ D. Only retrain models

PAUSE HERE: choose your answer before moving on.

What is the key difference between continuous delivery and continuous deployment?

- ☐ A. Delivery has no testing
- ☐ B. Deployment to production is manual in delivery and automatic in deployment
- ☐ C. Delivery is only for ML
- ☐ D. They are identical

PAUSE HERE: choose your answer before moving on.

Which sequence best matches Continuous Training (CT)?

A

A. Collect -> label -> delete -> archive

B

B. Monitor -> measure -> retrain -> serve

C

C. Build -> compile -> merge -> stop

D

D. Train once -> deploy once -> never update

PAUSE HERE: choose your answer before moving on.

Compared with DevOps, what extra items does MLOps need to validate?

- ☐ A. Only source code
- ☐ B. Data, data schemas, and models in addition to code/components
- ☐ C. Only user interfaces
- ☐ D. Only network speed

PAUSE HERE: choose your answer before moving on.

What does "ML is the high-interest credit card of technical debt" mean?

- ☐ A. ML requires credit cards to operate
- ☐ B. Training is always the most expensive step
- ☐ C. Building may be quick, but long-term maintenance can become difficult and costly
- ☐ D. ML systems never need maintenance

PAUSE HERE: choose your answer before moving on.

What is the correct order of the three lifecycle phases used in this module?

A A. Development -> Discovery -> Deployment

B B. Deployment -> Development -> Discovery

C C. Discovery -> Development -> Deployment

D D. Training -> Testing -> Validation

PAUSE HERE: choose your answer before moving on.

A historical feature is available for training but cannot be accessed when real predictions are made. What should you question first?

- ☐ A. Whether the ML use case is feasible
- ☐ B. Whether to guess the missing feature
- ☐ C. Whether to deploy immediately
- ☐ D. Whether to skip evaluation

PAUSE HERE: choose your answer before moving on.

After feasibility is established, which activity begins the development flow in this module?

A

A. Model monitoring

B

B. Data pipeline creation and feature engineering

C

C. Deleting training data

D

D. Production rollback

PAUSE HERE: choose your answer before moving on.

Which activity belongs to the deployment phase?

- ☐ A. Only defining the initial business problem
- ☐ B. Planning hosting, operationalization, monitoring, health checks, and alerts
- ☐ C. Only selecting the first algorithm
- ☐ D. Only cleaning the historical dataset

PAUSE HERE: choose your answer before moving on.

Which mapping of MLOps maturity levels is correct?

- ☐ A. Level 0 fully automated; Level 1 manual; Level 2 no deployment
- ☐ B. Level 0 manual; Level 1 training-pipeline automation; Level 2 integrated automation of training, validation, and deployment
- ☐ C. All levels are identical
- ☐ D. Level 0 monitoring only; Level 1 data collection only; Level 2 training only

PAUSE HERE: choose your answer before moving on.

Answer Key 1/2

Check both the answer and the reason - not just the letter.

Q1. B MLOps basics

MLOps manages the ML lifecycle across data, code, resources, time, quality, deployment, and operations.

Q2. A Practitioner pain points

Versioning, experiment tracking, collaboration, reproducibility, and traceability are core operational pain points.

Q3. B Reproducibility

A production model should be repeatable and traceable so teams can rebuild, compare, audit, and update it.

Q4. B Operationalization

The operational view is broader than model accuracy: it balances time, resources, and quality end to end.

Q5. B Continuous Integration

CI reduces divergence by integrating changes frequently and validating them through automated build and test steps.

Q6. B Continuous Delivery vs Deployment

Both automate build-test-release cycles; continuous deployment additionally automates the production release.

Q7. B Continuous Training

CT helps models adapt as data changes by monitoring performance, measuring change, retraining, and serving updated models.

Answer Key 2/2

Check both the answer and the reason - not just the letter.

Q8. B MLOps vs DevOps

ML behavior depends on data and models, so MLOps testing extends beyond conventional code testing.

Q9. C Technical debt

The hidden cost often appears later in integration, monitoring, retraining, dependencies, drift, and maintenance.

Q10. C ML lifecycle

The module groups the lifecycle into Discovery, Development, and Deployment, with iteration and overlap between stages.

Q11. A Discovery / feasibility

A feature used by the model must be available or reproducible at inference time; otherwise the production design may be infeasible.

Q12. B Development phase

Development begins by preparing reliable data pipelines and features before iterative model building and evaluation.

Q13. B Deployment phase

Deployment is not just serving a model; it also includes operationalization, monitoring, drift detection, and maintenance planning.

Q14. B MLOps maturity

Higher MLOps maturity means more automation and tighter integration across the end-to-end ML pipeline.

SCORE GUIDE

12-14: Strong foundation | 9-11: Good - review missed concepts
0-8: Revisit CI/CD/CT, lifecycle, technical debt, and maturity levels
